Details on test animals and environmental conditions
TEST ANIMALS
- Source: Charles River Laboratories Japan, Inc. Atsugi
- Age at study initiation: 5 weeks
- Weight at study initiation: Males: 149-168 g ; Females: 135-155 g
- Housing: bracket-type metallic wire-mesh cages (W 260 × D 380 × H 180 mm)
- Diet: ad libitum
- Water: ad libitum
- Acclimation period: 7 days(male), 8 days(female)

ENVIRONMENTAL CONDITIONS
- Temperature (°C): 22.8-24.7°C (acceptable range: 22±3°C)
- Humidity (%): 51-60 % (acceptable range: 55±10 %)
- Air changes: >10 times / hr
- Photoperiod: 12 hrs dark / 12 hrs light

Administration / exposure

Route of administration
oral: gavage

Vehicle
olive oil

Details on oral exposure
PREPARATION OF DOSING SOLUTIONS:
Test substance was dissolved in olive oil for injection.
Vehicle
- Name: olive oil (Japanese Pharmacopoeia)
- Lot Number: MI-13
- Manufacturer: Kozakai pharmaceutical Co., Ltd.
- Storage Conditions: Room temperature

Analytical verification of doses or concentrations
yes

Details on analytical verification of doses or concentrations
Test solutions were prepared at least once in 8 days and used within 7 days of preparation.
The test solutions were analyzed concentration after 0days, 4days and 8days preparation.
The results showed that the concentrations were all within the acceptable range.

Duration of treatment / exposure
28 days

Frequency of treatment
once a day

Control animals
yes, concurrent vehicle

Details on study design
Dose selection rationale: Doses in this test were set based on the results of the following dose setting study: a 14-day repeated dose oral toxicity test (doses: 0 (vehicle), 50, 100, 200, 500,and 1000 mg/kg bw/day).
At 100 mg/kg bw/day, significantly lower total cholesterol levels were observed in males and higher relative liver weights in females.
At 200 mg/kg bw/day, significantly higher absolute and relative liver weights were observed in fem ales.
At 500 mg/kg bw/day, significant increases in relative kidney weights were observed in males and relative liver weights in females.
At 1000 mg/kg bw/day, significantly lower total cholesterol levels and higher relative liver weights were observed in males.
At 1000 mg/kg bw/day, significantly higher absolute and relative liver and kidney weights were ob served in females.
In this study, the highest dose was 1000 mg/kg bw/day, which is expected to cause toxic effects after repeated administration for 28 days, and the lowest dose was 8 mg/kg bw/day, which is expected to cause no toxic effects.
Therefore, the high dose in this study was set at 1000 mg/kg bw/day, and a low dose of 8 mg/kg bw/day.

- Rationale for animal assignment (if not random): Body weight-balanced randomization
- Post-exposure recovery period in satellite groups: 14 days

Examinations

Observations and examinations performed and frequency
All animals were subjected to detailed clinical observations once before the start of administration Thereafter, detailed clinical observations were made once a week in dosing and recovery periods.

CAGE SIDE OBSERVATIONS: Yes
Males and females: 4 times/day during the administration period (before and after dosing, 4 hours after dosing) , once a day during the recovery period.

DETAILED CLINICAL OBSERVATIONS: Yes

BODY WEIGHT: Yes
Body weights were determined on days 1, 7, 14, 21 and 28 of administration.
Body weights were determined on the day of 7 and 14 of recovery.
Body weights were determined on the day of necropsy.

FOOD CONSUMPTION AND COMPOUND INTAKE (if feeding study):yes
Food consumption was determined on days 5, 12, 19 and 26 of administration for males.
Food consumption was determined on days 5 and 12 of recovery for males.
Food consumption was determined on days 4, 11, 18 and 25 of administration for females.
Food consumption was determined on days 4 and 11 of recovery for females.

OPHTHALMOSCOPIC EXAMINATION: yes

HAEMATOLOGY: Yes

CLINICAL CHEMISTRY: Yes

URINALYSIS: Yes
Animals fasted: no

Sacrifice and pathology
NECROPSY: yes
[brain, pituitary, eye ball, thyroid, spinal cord, heart, trachea, lung, liver, kidney, thymus, spleen, adrenal gland, stomach, ovary, uterus, bladder, sciatic nerve, lymph node, bone marrow]

HISTOPATHOLOGY: yes

Statistics
The data were analyzed for homogeneity of variance by the Bartlett test. If variances were homogeneous, data was analyzed by the Dunnett test, whereas heterogeneous data was analyzed by the steel test.

Comparisons between the two groups were performed by F-test, followed by Student's t-test if va riance was uniform, and Aspin-Welch's t-test if variance was not uniform.
Comparisons between multiple groups were performed by Kruskal-Wallis's rank test. When the results showed significant differences, the groups were compared with the control group by the Dunnett type test. Comparisons between the two groups were performed by Mann-Whitney's U-test.

Results and discussion

Results of examinations

Clinical signs
no effects observed

Mortality
no mortality observed

Body weight and weight changes
no effects observed

Food consumption and compound intake (if feeding study)
no effects observed

Haematological findings
no effects observed

Description (incidence and severity)
At 8 mg/kg bw/day in males and females and at 40 mg/kg bw/day in males, low activated partial thromboplastin times were significantly observed at the end of the dosing period.
At 200 mg/kg bw/day, low values of hemoglobin and hematocrit in males and prothrombin time and activated partial thromboplastin time in females were significantly observed.
At 200 mg/kg bw/day, a significant increase in reticulocyte count was observed in females.

However, no dose relationship was observed for these changes.

Clinical biochemistry findings
effects observed, treatment-related

Description (incidence and severity)
At 40 mg/kg bw/day in females, significantly lower values of cholinesterase were observed at the end of the a dministration period.

At 200 mg/kg bw/day, high levels of LDH and γ-GTP and low total cholesterols and urea-nitrogen were significantly observed in females. However, none of them was dose-related.

At 200 mg/kg bw/day, low creatinine was significantly observed in males. However, the values were within the reference values in the background data and no dose relationship was evident.
A significant increase in AST was observed in males at the end of the recovery period. Low total cho lesterol levels were significantly observed in males. In females, high levels of γ-GTP and sodium were significantly observed.
These changes were considered to be spontaneous, because there were not observed and changes were not dose dependent. and recovered by withdraw.

Urinalysis findings
no effects observed

Description (incidence and severity)
At 200 mg/kg bw/day, a significantly higher number of voids per week of dosing were observed in males. However, these changes were not dose-related, and no changes were observed after Week 2 . Therefore, these changes were considered incidental.

Behaviour (functional findings)
no effects observed

Organ weight findings including organ / body weight ratios
effects observed, treatment-related

Description (incidence and severity)
At 40 mg/kg bw/day, higher kidneys relative weights were significantly observed in males in animals sacrificed at the end of the administration period.

At 200 mg/kg bw/day, high absolute and relative liver weights were significantly observed in females.
Absolute and relative ovarian and thyroid weights were significantly higher in females than 200 mg/kg bw/day.
At 1000 mg/kg bw/day, a significant increase in relative liver weights was observed in males.
At 1000 mg/kg bw/day, females had significantly lower relative thymic weights.
In the animals sacrificed at the end of the recovery period, high absolute thyroid weights were signif icantly observed in males, but no changes in relative weights were observed.
Higher relative thymus weights and lower relative pituitary weights were significantly observed in fema les.
These changes were observed in the organs/tissues, but they were thought to be incidental changes based on the incidence of their occurrence and their histopathological profiles.

Gross pathological findings
no effects observed

Histopathological findings: non-neoplastic
effects observed, treatment-related

Description (incidence and severity)
At the end of the treatment period, in sacrificed animals:
At 200 mg/kg bw/day, diffuse hyperplasia of mild follicular epithelial cells in the thyroid gland was o bserved in two females.
At 1000 mg/kg bw/day, diffuse hyperplasia of mild follicular epithelial cells in the thyroid gland was significantly observed in 4 females.

Applicant's summary and conclusion

Conclusions
Based on changes in relative kidney weight and blood cholinesterase levels, the NOAEL for repeated-dose toxicity of 4,4'-methylenebis(2,6-di-tert-butylphenol) was determined to be 8 mg/kg bw/day in rats.

Executive summary

The repeated-dose toxicity of 4,4'-methylenebis(2,6-di-tert-butylphenol) was investigated in rats according to the OECD TG 407. Male and female rats (5 or 10 animals/sex/dose) were treated with 4,4'-methylenebis(2,6-di-tert-butylphenol at doses of 0 (vehicle: olive oil), 8, 40, 200, and 1,000 mg/kg bw/day for 28 days. Five out of the 10 animals/sex treated with 0 and 1,000 mg/kg bw/day were assigned as a recovery group.

There were no deaths in either sex. At doses of ≥40 mg/kg bw/day, the relative kidney weight was increased in males, and blood cholinesterase levels were decreased in females. At doses of ≥200 mg/kg bw/day, mean corpuscular volume and mean corpuscular hemoglobin levels were decreased in males, and mean corpuscular hemoglobin concentration was decreased in females. Absolute and relative weights of the thyroid gland were increased, and histopathological analysis showed slight diffuse hyperplasia of follicular cells of the thyroid gland was increased with doses of 200 and 1000 mg/kg bw/day. Absolute and relative weights of the ovary were increased without histopathological changes with doses of ≥200 mg/kg bw/day. These changes were no longer found after the recovery period. Based on changes in relative kidney weight and blood cholinesterase levels, the NOAEL for repeated-dose toxicity of 4,4'-methylenebis(2,6-di-tert-butylphenol) was determined to be 8 mg/kg bw/day in rats.

Analytical verification of doses or concentrations
yes

Details on analytical verification of doses or concentrations
Test solutions were prepared at least once in 8 days and used within 7 days of preparation.
The test suspensions at all dose concentrations to be used for administration in week 1 or week 6 of administration, dose concentrations and homogeneity were verified by the HPLC method at Gotemba Laboratory, Bozo Research Center Inc. before use for administration.
The results showed that the concentrations were 97.5 to 103.5% and the coefficient of variation in the range from 0.5 to 4.6%, both of which were within the acceptable range (concentration: within 100.0 ± 10.0% of the nominal value, homogeneity: CV within 10.0%)

Duration of treatment / exposure
Males: 42 days (14 days prior to mating, 14 days during the mating period and 14 days after the end of the mating period),
Females: 41 to 50 days (14 days prior to mating and throughout the mating and gestation periods until day 4 of lactation)

Non-pregnant females: 53 days

Frequency of treatment
once a day (7 times/week)

Dose / conc.	
1000	mg/kg bw/day (actual dose received)

No. of animals per sex per dose
12 animals/sex/dose

Control animals
yes, concurrent vehicle

Details on study design
The dose levels of this study were selected based on the results of the previously conducted study, “A 14-day oral gavage toxicity study of 2,2’,6,6’-tetra- tert-butyl-4,4’-methylenediphenol in rats (dose-finding study)”). In that study, there were no toxic changes at 1000 mg/kg, which is the limit test dose prescribed in the OECD Guidelines for Testing of Chemicals 421. Based on these results, the high dose in this reproduction/developmental toxicity screening test was set at 1000 mg/kg, and the lower doses were set at 300 and 100 mg/kg using the common ratio of approximately 3.

- Rationale for animal assignment (if not random): Body weight-balanced randomization
- Post-exposure recovery period in satellite groups: 14 days

Examinations

Observations and examinations performed and frequency
CAGE SIDE OBSERVATIONS: Yes
Males and females: 3 times/day during the administration period (before and after dosing)
DETAILED CLINICAL OBSERVATIONS: Yes

BODY WEIGHT: Yes
males : days 1, 4, 8, 11, 15, 18, 22, 25, 29, 32, 36, 39 and 42 of administration and the day of n ecropsy,
females : days 1, 4, 8, 11, 15 of administration, days 0, 4, 7, 11, 14, 17 and 20 of gestation, days 0 and 4 of lactation and the day of necropsy
uncopulated females : days 18, 22 and 25 of administration during the mating period),

FOOD CONSUMPTION AND COMPOUND INTAKE (if feeding study):yes
males : days 1, 4, 8, 11, 15, 32, 36, 39 and 42 of administration
females : days 1, 4, 8, 11 and 15 of administration, days 1, 4, 7, 11, 14, 17 and 20 of gestation and days 2 and 4 of lactation.

OPHTHALMOSCOPIC EXAMINATION:yes

HAEMATOLOGY: no

CLINICAL CHEMISTRY: no

URINALYSIS: no

Sacrifice and pathology
Necropsy:yes
[Detailed macroscopic examination: including the external appearance, head, thorax and abdomen]

histopathology: yes
[testes, epididymides, ovaries, uterus, prostate, seminal vesicle, vagina, macroscopic lesions]

Statistics
Group mean with standard deviation was calculated and subjected to a Dunnett-type mean rank test for the difference in mean rank (levels of significance: 0.05 and 0.01, two-tailed).
For the copulation index, insemination index, fertility index and delivery index, the number of co pulated animals, number of males impregnated females, number of pregnant females and the number of females that delivered liveborn pups were calculated for each group and analyzed by the chi-square test with Yates’ continuity correction (levels of significance: 0.05 and 0.01, two-tailed). If the re were cells whose expected frequency was 5 or below, data were analyzed by Fisher’s exact test (levels of significance: 0.05 and 0.01, two-tailed) .

Results and discussion

Results of examinations

Clinical signs
no effects observed

Mortality
no mortality observed

Body weight and weight changes
no effects observed

Food consumption and compound intake (if feeding study)
no effects observed

Description (incidence and severity)
In females in the 1000 mg/kg group, significantly low values compared to that of the control group w ere observed on day 15 of administration and on days 1 and 14 of gestation, but since there were no abnormalities in the body weight development in any period, the changes were thought to be of no toxicological significance.

Organ weight findings including organ / body weight ratios
no effects observed

Gross pathological findings
no effects observed

Description (incidence and severity)
The following changes were observed in the organs/tissues listed below, but they were thought to be incidental changes based on the incidence of their occurrence and their pathological profiles:
small testis and epididymis (unilateral) in 1/12 males in the 1000 mg/kg group, white focus in the epi didymis in 1/12 males in the 300 mg/kg group, large testis (unilateral) in 1/12 males in the 100 mg/kg group, and diverticulum in the ileum in 1/12 females in the 300 mg/kg group

Histopathological findings: non-neoplastic
no effects observed

Description (incidence and severity)
The some changes were observed in the organs/tissues, but they were thought to be incidental changes based on the incidence of their occurrence and their histopathological profiles.

Applicant's summary and conclusion

Executive summary

A reproduction/developmental toxicity screening test (OECD TG 421) was conducted to clarify the effects of 4,4'-methylenebis(2,6-di-tert-butylphenol) on reproductive and developmental toxicity. Male rats were treated with 4,4'-methylenebis(2,6-di-tert-butylphenol) at doses of at 0 [vehicle: 0.5% (w/v) methylcellulose solution], 100, 300, and 1,000 mg/kg bw/day for 14 days prior to mating and throughout the mating period until the day before necropsy (42 days), and female rats were treated for 14 days prior to mating and throughout the mating and gestation periods until day 4 of lactation (41–50 days). There were no mortalities with any dose during the treatment period. There were no advserse effects at 1000 mg/kg/day.

Metabolic activation
with and without

Metabolic activation system
S9 mix, SD male rat liver, induced by phenobarbital (PB) and 5,6-benzoflavone (BF)

Test concentrations with justification for top dose
To set the dose levels for the main tests, a total of 8 dose levels were selected (20, 50, 100, 200, 500, 1000, 2000 and 5000 µg/plate) in the dose-selection test.
In the dose-selection test, growth inhibition by the test substance was not observed all dose levels.
Precipitation by the test substance on the plate was observed at 200 µg/plate and above.
Test were set as the highest dose levels 5000 µg/plate for all tested strains with or without metabolic a ctivation, and a total of 6 dose levels were selected using a common ratio of 2.

METHOD OF APPLICATION:

Exposure duration: [continuous treatment]: 24, 48 hrs [short-term treatment]:6 hrs + 18 hr
SPINDLE INHIBITOR: Colcemid
NUMBER OF REPLICATIONS: 2
NUMBER OF CELLS EVALUATED: 200 cells / dose
DETERMINATION OF CYTOTOXICITY
- Method: relative total growth

Evaluation criteria
For the evaluation of the frequencies of structural aberrations and of polyploidy induced, the following criteria were employed.
Appearance incidence of cells with chromosomal aberrations: Negative (-): < 5%; equivocal (±): 5 -10%; positive (+): > 10%.
Finally, the substance is positive when the incidence is considered to be dose-related and reproducible.

Details on test animals and environmental conditions
TEST ANIMALS
- Source: Charles River Laboratories Japan, Inc. Atsugi
- Age at study initiation: 10 weeks
- Weight at study initiation: Males: 392 - 449g; Females: 228 - 274g
- Housing: bracket-type metallic wire-mesh cages (W 254 × D 350 × H 170 mm)
- Diet: ad libitum
- Water: ad libitum
- Acclimation period: 18 days

ENVIRONMENTAL CONDITIONS
- Temperature (°C): 22-25 (acceptable range:23±3 °C)
- Humidity (%): 38-64 (acceptable range:50±20 %)
- Air changes: 10-15 times / hr
- Photoperiod: 12 hrs dark / 12 hrs light

Administration / exposure

Route of administration
oral: gavage

Vehicle
other: 0.5 w/v% methylcellulose solution

Details on mating procedure
M/F ratio per cage:1:1
- Length of cohabitation:up to 14 days
- Proof of pregnancy: [vaginal plug / sperm in vaginal smear] referred to as [day 0] of pregnancy

Analytical verification of doses or concentrations
yes

Details on analytical verification of doses or concentrations
Test solutions were prepared at least once in 8 days and used within 7 days of preparation.
The test suspensions at all dose concentrations to be used for administration in week 1 or week 6 of administration, dose concentrations and homogeneity were verified by the HPLC method at Gotemba Laboratory, Bozo Research Center Inc. before use for administration.
The results showed that the concentrations were 97.5 to 103.5% and the coefficient of variation in the range from 0.5 to 4.6%, both of which were within the acceptable range (concentration: within 100.0 ± 10.0% of the nominal value, homogeneity: CV within 10.0%)

Duration of treatment / exposure
Males: 42 days (14 days prior to mating, 14 days during the mating period and 14 days after the end of the mating period),
Females: 41 to 50 days (14 days prior to mating and throughout the mating and gestation periods until day 4 of lactation)

Non-pregnant females: 53 days

Frequency of treatment
once a day (7 times/week)

Doses / concentrations

Dose / conc.	
1000	mg/kg bw/day (actual dose received)

No. of animals per sex per dose
12 animals/sex/dose

Control animals
yes, concurrent vehicle

Details on study design
The dose levels of this study were selected based on the results of the previously conducted study, “A 14-day oral gavage toxicity study of 2,2',6,6'-tetra- tert-butyl-4,4'-methylenediphenol in rats (dose-finding study)”). In that study, there were no toxic changes at 1000 mg/kg, which is the limit test dose prescribed in the OECD Guidelines for Testing of Chemicals 421. Based on these results, the high dose in this reproduction/developmental toxicity screening test was set at 1000 mg/kg, and the lower doses were set at 300 and 100 mg/kg using the common ratio of approximately 3.

- Rationale for animal assignment (if not random): Body weight-balanced randomization
- Post-exposure recovery period in satellite groups: 14 days

Examinations

Parental animals: Observations and examinations
Males and females: 3 times/day during the administration period (before and after dosing)

Observation for completion of delivery (measurement and observation on day 0 of lactation) was con ducted twice daily from day 21 of gestation to day 25 of gestation.

Oestrous cyclicity (parental animals)
yes

Sperm parameters (parental animals)
no

Litter observations
no

Postmortem examinations (parental animals)
Necropsy:yes
[Detailed macroscopic examination: including the external appearance, head, thorax and abdomen]

histopathology: yes
[testes, epididymides, ovaries, uterus, prostate, seminal vesicle, vagina, macroscopic lesions]

Postmortem examinations (offspring)
yes
examine for abnormalities in organs/tissues in the external, thoracic and abdominal regions.

Statistics
mean value with standard deviation : [Body weight, body weight gain (from day 1 to day 42 of adminis tration for males, from day 1 to day 15 of administration, from day 0 to day 20 of gestation, and from day 0 to day 4 of lactation for females, and from day 0 to day 4 after birth for liveborn pups), food co nsumption, number of estruses, estrous cycle, number of elapsed days until copulation, length of ge station period, number of corpora lutea, number of implantation sites, number of pups alive, sex ratio (on day 0 and day 4 after birth) and organ weight (including body weight at necropsy)]

group mean with standard deviation was calculated and subjected to a Dunnett-type mean rank test for the difference in mean rank (levels of significance: 0.05 and 0.01, two-tailed): [stillbirth index, index of external abnormalities, live birth index and viability index on day 4 after birth]

chi-square test with Yates’ continuity correction (levels of significance: 0.05 and 0.01, two-tailed): [the copulation index, insemination index, fertility index and delivery index, the number of copulated animals, number of males impregnated females, number of pregnant females and the number of f emales that delivered liveborn pups were calculated for each group]

If there were cells whose expected frequency was 5 or below, data were analyzed by Fisher’s exact test (levels of significance: 0.05 and 0.01, two-tailed)

Reproductive indices
Copulation index (%) = (No. of copulated animals / No. of animals housed together) × 100
Insemination index (%) = (No. of males impregnated females / No. of copulated males) × 100
Fertility index (%) = (No. of pregnant females / No. of copulated females) × 100
Gestation period (days) = Number of days from day 0 of gestation to the day of delivery
Delivery index (%) = (No. of females delivered liveborn pups / No. of pregnant females) × 100
Implantation index (%) = (No. of implantation sites / No. of corpora lutea) × 100
Stillbirth index (%) = (No. of stillborn pups / Total No. of liveborn and stillborn pups) × 100
Index of external abnormalities (%) = (No. of pups with external abnormalities / No. of liveborn pups) × 100
Live birth index (%) = (No. of liveborn pups / No. of implantation sites) × 100
Sex ratio on day 0 after birth = No. of liveborn males / No. of liveborn pups
Sex ratio on day 4 after birth = No. of males alive on day 4 after birth / No. of pups alive on day 4 after birth

Offspring viability indices
Viability index on day 4 after birth (%) = (No. of surviving pups on day 4 after birth / No. of liveborn pups) × 100

Results and discussion

Results: P0 (first parental generation)

General toxicity (P0)

Clinical signs
no effects observed

Mortality
no mortality observed

Body weight and weight changes
no effects observed

Food consumption and compound intake (if feeding study)
no effects observed

Description (incidence and severity)
In females in the 1000 mg/kg group, significantly low values compared to that of the control group w ere observed on day 15 of administration and on days 1 and 14 of gestation, but since there were no abnormalities in the body weight development in any period, the changes were thought to be of no toxicological significance.

Haematological findings
not examined

Clinical biochemistry findings
not examined

Urinalysis findings
not examined

Behaviour (functional findings)
not examined

Organ weight findings including organ / body weight ratios
no effects observed

Gross pathological findings
no effects observed

Description (incidence and severity)
The following changes were observed in the organs/tissues listed below, but they were thought to be incidental changes based on the incidence of their occurrence and their pathological profiles:
small testis and epididymis (unilateral) in 1/12 males in the 1000 mg/kg group, white focus in the epi didymis in 1/12 males in the 300 mg/kg group, large testis (unilateral) in 1/12 males in the 100 mg/kg group, and diverticulum in the ileum in 1/12 females in the 300 mg/kg group

Histopathological findings: non-neoplastic
no effects observed

Description (incidence and severity)
The some changes were observed in the organs/tissues, but they were thought to be incidental changes based on the incidence of their occurrence and their histopathological profiles.

Applicant's summary and conclusion

Conclusions
The NOAEL of 4,4'-methylenebis(2,6-di-tert-butylphenol) for reproductive and developmental toxicity was determined to be 1,000 mg/kg/day (the highest dose tested).

Executive summary

A reproduction/developmental toxicity screening test (OECD TG 421) was conducted to clarify the effects of 4,4'-methylenebis(2,6-di-tert-butylphenol) on reproductive and developmental toxicity. Male

rats were treated with 4,4'-methylenebis(2,6-di-tert-butylphenol) at doses of at 0 [vehicle: 0.5% (w/v) methylcellulose solution], 100, 300, and 1,000 mg/kg bw/day for 14 days prior to mating and throughout the mating period until the day before necropsy (42 days), and female rats were treated for 14 days prior to mating and throughout the mating and gestation periods until day 4 of lactation (41–50 days). There were no mortalities with any dose during the treatment period. There were no effects on reproductive toxicity (fertility and reproductive organs) and developmental toxicity up to the highest dose. The NOAEL of 4,4'-methylenebis(2,6-di-tert-butylphenol) for reproductive and developmental toxicity was determined to be 1,000 mg/kg/day (the highest dose tested).
